Art Unit: 2629

DETAILED ACTION

1. The finality of that action mailed 2/7/07 is withdrawn. Claims 1, 2 and 4 are pending in the application.

2. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

- (b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.
- 4. Claims1, 2, 4 are rejected under 35 U.S.C. 102(b) as being anticipated by Suzuki et al (US 4,621,260 hereinafter Suzuki).

As to claim 1, Figs. 2 and 3 of Suzuki discloses a liquid crystal display comprising:

thin film transistors (20) connected to intersections between a plurality of data lines (Y1-Yn) and a plurality of gate lines (X1-Xm);

pixel electrodes (22), each of which is connected to a source (34) of each of the thin film transistors (20);

common electrodes opposed to the pixel electrodes;

liquid crystal Injected between the pixel electrodes and the common electrodes;

Application/Control Number: 10/656,576

Art Unit: 2629

a plurality of auxiliary gate lines (Z1-Zm), each of said auxiliary gate lines having a signal with a polarity that is opposite to the polarity of a signal on a corresponding gate line (col. 5, lines 30-32 and Figs. 4A, 4C);

first capacitors (28), each of which is connected between the source and each of the auxiliary gate lines;

wherein the polarity of the voltage applied to the auxiliary gate line is opposite to that applied to the gate line (col. 5, lines 30-32, and Figs. 4A and 4C).

As to claim 2, Suzuki teaches the liquid crystal display having a second capacitor (26) is connected between the source and each of the common electrodes (it is inherent the common electrode is connected to ground).

As to claim 4, Suzuki teaches the first capacitor (28) has capacitance (Cz) identical to that of parasitic capacitance (Cp) between the source and gate of the thin film transistor (see col. 1-17, set $\Delta v=0$, then Cp=Cz).

Claim Rejections - 35 USC § 103

5. Claims 1 and 2 are rejected under 35 U.S.C. 103(a) as being unpatentable over Ikeda (US Patent No. 4,393,405) in view of Ozawa et al. (US Patent No. 6,839,045)

As to claim 1, Ikeda discloses a liquid crystal display (Fig. 1) comprising: thin film transistors (102) connected to intersections between a plurality of data lines (D1...Dn) and a plurality of gate lines (G1...Gm); pixel electrodes (e.g., top portion electrode of the LCD cell 104), each of which is connected to a source of each of the thin film transistors; common electrodes (e.g. bottom portion electrode of the LCD cell 104) opposed to the pixel electrodes; liquid crystal (104) injected between the pixel electrodes and the common electrodes. It is noted

Art Unit: 2629

that Ikeda does not discloses a plurality of auxiliary gate lines corresponding to the gate lines, and first capacitors, each of which is connected between the source and each of the auxiliary gate lines.

Ozawa is cited to teach an active matrix flat panel display similar to Ikeda. Ozawa further discloses a plurality of auxiliary gate lines (e.g. cline line as shown in Fig. 2), each of the auxiliary data lines having a signal with a polarity that is opposite to the polarity of a signal on a corresponding gate lines and the polarity of the voltage applied to the auxiliary gate line is opposite to that applied to the gate line (col. 25, line 48 to col. 26, line 3 for example), and first capacitors (e.g. cap as shown in Fig. 2), each of which is connected between the source and each of the auxiliary gate lines (see Fig. 2). It would have been obvious to one of ordinary skill in the art to have modified Ikeda with the features of the auxiliary gate lines as taught by Ozawa because the capacitor connected to the auxiliary gate line can maintain the pixel voltage even the transistor is turned "off" (see col. 9, lines 50-67).

As to claim 2, Ikeda as modified discloses a second capacitor (103) is connected between the source and each of the common electrodes (e.g. the capacitor 103 is connected to the common electrode of the pixel in the same common line as shown in Fig. 1).

Response to Arguments

- 6. Applicant's arguments with respect to claims 1, 2 and 4 have been considered but are most in view of the new ground(s) of rejection.
- 7. Any inquiry concerning this communication or earlier communications from the examiner should be directed to Regina Liang whose telephone number is (571) 272-7693. The examiner can normally be reached on Monday-Friday from 8AM to 5:00PM.

Art Unit: 2629

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Richard Hjerpe, can be reached on (571) 272-7691. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
